| (57) Abstract : Artificial intelligent based detection and prevention of various Breast Cancer using Machine Learning and Big Data for health care management Abstract: Breast cancer claims the lives of more women than any other type of cancer on a global scale. It is one of the deadliest diseases a woman may develop. Numerous factors contribute to breast cancer's progression and death, including the disease's difficulty in diagnosis and the fact that many women conceal their symptoms. As a result, organisations throughout the world are initiating campaigns to increase awareness about the critical nature of early detection of breast cancer. This study makes use of big data techniques such as transfer learning and convolutional neural networks to assist patients in acquiring a breast cancer diagnosis. The purpose of this research study is to discuss how these two technologies were combined to build a workable model. | |
